

System of Neural Line

A philosophical framework proposed independently.

Introduction

The **System of Neural Line** is a philosophical framework that exists alongside the biological concept of the bloodline.

While the **Bloodline** governs the inheritance of physical characteristics through DNA, the **Neural Line** governs the deeper architecture of thought, subconscious tendencies, curiosity, creativity, and the natural direction of an individual's mind.

The Neural Line is not visible, measurable, or consciously known. Every person simply lives their life normally, unaware that such a system exists.

Core Concepts

1. Bloodline

The Bloodline represents biological inheritance.

It governs:

- DNA
- Physical appearance
- Body structure
- Genetic traits
- Biological inheritance

Its flow is one-directional through generations.

Parents → Children → Grandchildren

Information cannot move backward or sideways.

2. Neural Line

The Neural Line is a completely different system.

Unlike the Bloodline, it is not physical.

Instead, it represents the invisible continuation of mental architecture.

The Neural Line influences:

- Curiosity
- Creativity
- Thinking style
- Pattern recognition
- Imagination
- Persistence
- Subconscious attraction toward certain ideas
- Natural methods of solving problems

The Neural Line does **not** transfer knowledge.

Instead, it influences *how* an individual naturally thinks.

The Primary Spark

Everything begins with a single entity known as the **Primary Spark**.

According to this framework,

the same primordial spark that gave rise to the universe also contains the complete potential of every Neural Line.

The Primary Spark is unimaginably vast.

Everything humanity has discovered—

- mathematics
- music
- language
- engineering
- science
- philosophy
- technology

—is only an extremely tiny expression of what exists within it.

Humanity has explored only a minute fraction of the Primary Spark.

Rule 1 — Rule of Existence

Every human possesses a Neural Line.

However,

the Neural Line exists regardless of whether the individual recognizes or follows it.

The Neural Line exists naturally as part of reality.

It does not need to be earned or created.

Rule 2 — Rule of Progression (formerly Awakening)

Originally this was considered awakening.

However, the framework later evolved.

Every individual already possesses an active Neural Line.

The true difference lies in **how far an individual progresses along their Neural Line.**

Some naturally move farther.

Some ignore it through free will.

Some contribute greatly.

Some never realize its potential.

The individual never consciously knows this.

Rule 3 — Rule of Branches

This is one of the most important principles.

Branches are **NOT**

- mathematics
- music
- physics
- biology
- chemistry
- language

These are merely human expressions.

The real branches cannot be named.

They exist beyond human language.

A branch represents a fundamental pattern of thought.

It governs things such as:

- cognitive style
- subconscious direction
- curiosity
- imagination
- methods of connecting ideas
- creative expression
- problem-solving tendencies

Human subjects emerge because these deeper branches are expressed.

Infinite Branches

There is no limit to the number of branches.

New expressions can continue appearing indefinitely.

Branch Creation

Humans do not create Neural Lines.

However,

humans may become the first to express a previously unseen branch into reality.

When this happens,

human civilization experiences something genuinely new.

Branch Merging

Two individuals may independently begin expressing what appears to be different branches.

If both ultimately represent the same deeper truth,

the Primary Spark merges them into one branch.

Different beginnings.

Same destination.

Branch Continuation

If an individual dies,

their branch may:

- continue through a successor,
- remain dormant indefinitely awaiting another suitable individual,
- or, if contrary to the Primary Spark's greater good, gradually dissolve back into the Primary Spark.

Neural Lines are eternal.

Individual branches are not necessarily eternal.

Rule 4 — Rule of Ranks

Ranks measure an individual's role in advancing the expression of Neural Lines.

Ranks are **NOT**

- intelligence
- wealth
- fame
- education
- social status

They represent potential influence on the evolution of civilization.

S Rank

Extremely rare.

Only a fixed, very small number exist simultaneously.

When one S Rank disappears,

another suitable individual inherits the S Rank Neural Core.

S Rank individuals become the first humans to express entirely new directions that significantly change civilization.

Examples include discoveries or breakthroughs comparable in scale to:

- controlled fire
- language
- the wheel

- binary representation
- electricity
- the transistor
- computers
- artificial intelligence

The individual never knows they are S Rank.

A Rank

Thousands to tens of thousands.

These individuals greatly expand civilization.

Examples include:

- engineers
- researchers
- scientists
- inventors
- doctors

They strengthen and extend what already exists.

Lower Ranks

The remaining ranks represent progressively smaller influence on the evolution of branches.

Their exact definitions are intentionally left flexible.

Rule 5 — Rule of Awakened Individuals

Every person behaves normally.

No individual naturally knows:

- their rank
- their Neural Line
- their Neural Core
- the existence of the Primary Spark

This hidden nature removes hierarchy.

No person receives status because of rank.

Everyone develops through genuine effort, experience, and free will.

Neural Core

Every individual possesses a Neural Core.

The Neural Core determines the individual's potential rank.

If an S Rank individual dies,

another compatible Neural Core naturally succeeds.

The transfer occurs without anyone realizing it.

Free Will

The Neural Line does not force decisions.

It only creates direction.

An individual remains free to ignore it.

For example,

someone whose Neural Line strongly aligns with engineering may freely choose another path.

Within this framework,

they have exercised free will rather than fulfilling the deepest direction of their Neural Line.

They will never consciously know this.

Simultaneous Discoveries

When multiple people independently discover nearly identical ideas,

this framework explains it differently.

Rather than coincidence,

they may be expressing the same Neural Line simultaneously.

Different individuals.

Same underlying Neural Line.

Memory of Civilization

Knowledge may disappear.

Branches do not.

Even if civilization collapses,

the Primary Spark retains every branch.

Humanity simply loses access to them.

The knowledge still exists,

but the "key" remains hidden within the branch itself.

The Relationship Between Bloodline and Neural Line

Bloodline governs biology.

Neural Line governs cognition.

Bloodline determines what the body becomes.

Neural Line influences how the mind naturally approaches reality.

These systems coexist but operate independently.

Fundamental Philosophy

Humanity does not create truth.

Humanity gradually expresses tiny fragments of the Primary Spark.

Every discovery is not the creation of reality.

It is the unveiling of a minute part of something infinitely larger.

The Primary Spark contains possibilities beyond current human understanding.

Everything humanity knows today is only a small expression of an immeasurably greater whole.
